

Drought and Precipitation Statement for Antigua – July 2010

Dale C. S. Destin
Antigua and Barbuda Meteorological Service
August 21, 2010

Above normal rainfall continues

The island continues to experience above normal rainfall, which started in April 2010. The average total rainfall for July of 4.92 inches was above normal for Antigua. This total was also the highest for July since 2005 and the 22nd highest on record for the month. Further, the rainfall for the season (period) May to July was the highest since 2004 and the 15th highest ever. Based on various models, trends, climatology and subjective input, above normal rainfall is most likely through the season September to November (SON). See table 1 for the rainfall totals for the past 24 months.

Period	Rainfall (inches)			Description	Rainfall Record			
	Actual	Standard Normal	Anomaly (1961 – 1990)		Max	Year	Min	Year
1(Jul)	4.92	3.78	+1.14	Above Normal	8.85	1963	0.62	1976
3(May – Jul)	16.38	11.02	+5.36	Above Normal	28.09	1970	2.86	1974
6(Feb – Jul)	28.02	17.80	+10.22	Well Above Normal	32.19	1970	7.04	1974
9(Nov – Jul)	36.78	30.73	+6.05	Above Normal	50.03	1987	14.81	1974
12(Jun – Jul)	47.60	46.20	+1.40	Near Normal	71.06	1952	28.78	1974
24(Jun – Jul)	105.79	92.39	+13.40	Above Normal	132.22	1952	66.71	1974

Table 1: Rainfall (inches) over the past 24 months.

Drought

Drought in general means water shortage and rainfall deficiency. This is assessed by first examining the rainfall periods of three months or more for selected places to see whether they lie below the 30th percentile (lowest 30% of records). The approach used to determine the rainfall deficit is an adjusted version of the decile method developed by Gibbs and Maher (1967). An adjusted version of this method is used as the measurement of droughts within the Australian Drought Watch System. The drought levels, based on historical data, are defined as follow:

- **Slight:** rainfall ranges from less than 30th percentile to the 20th percentile
- **Moderate:** rainfall ranges from less than the 20th percentile to the 10th percentile
- **Serious:** rainfall ranges from less than the 10th percentile to the 5th percentile
- **Severe:** rainfall less than the 5th percentile

Rainfall Description

The following definitions are being used in the description of rainfall:

- **Well Below normal:** Rainfall totals in the lowest 10% of the historical data
- **Below Normal:** Rainfall totals in the lowest 30% of the historical data, but not in the lowest 10%
- **Near Normal:** Rainfall totals in the middle 40% of the historical data
- **Above Normal:** Rainfall totals in the highest 30% of the historical data, but not the highest 10%
- **Well Above Normal:** Rainfall totals in the highest 10% of the historical data
- **Rainfall:** Island average, based on rainfall at the airport and Green Castle
