September 15, 2011

Well above rainfall for August

The island had well above normal rainfall during August with a total of 9.50 inches. This is the second highest since 1995 and the ninth highest on record. Further, this was the fourth wettest summer (June to August (JJA)) with well above normal rainfall. The island continues to be in a period of abundant rainfall which started in April.

Based on various models, trends, climatology and subjective input, near normal rainfall is most likely for September and above normal for autumn - SON. There is only a slight chance of drought for SON. See table 1 for the rainfall totals for the past 24 months.

Period	Rainfall (inches)			Description (1981 – 2010)	Rainfall Record – 1928 to 2011			
	Actual	Normal (1981 – 2010)	Anomaly (1981 – 2010)		Max	Year	Min	Year
1(Aug)	9.50	4.45	+ 5.05	Well above normal	13.23	2010	1.52	1984
3(Jun – Aug)	20.90	11.12	+ 9.78	Well above normal	24.48	2010	5.63	1984
6(Mar – Aug)	36.04	20.61	+ 15.43	Well above normal	40.53	2010	9.09	1939
9(Dec – Aug)	43.56	29.50	+ 14.06	Well Above normal	49.05	1952	15.23	1939
12(Sep – Aug)	61.01	47.29	+ 13.72	Well above normal	71.84	1952	27.56	1984
24(Sep – Aug)	118.85	94.41	+ 24.44	Well above normal	130.76	1952	66.07	1966

Table 1: Rainfall (inches) over the past 24 months.

Drought

Drought in general means water shortage and rainfall deficiency. This is assessed by first examining the rainfall periods of three months or more for selected places to see whether they lie below the 30th percentile (lowest 30% of records). The approach used to determine the rainfall deficit is an adjusted version of the decile method developed by Gibbs and Maher (1967). An adjusted version of this method is used as the measurement of droughts within the Australian Drought Watch System. The drought levels, based on historical data, are defined as follow:

- **Slight:** rainfall ranges from less than 30th percentile to the 20th percentile
- **Moderate:** rainfall ranges from less than the 20th percentile to the 10th percentile
- **Serious:** rainfall ranges from less than the 10th percentile to the 5th percentile
- **Severe:** rainfall less than the 5th percentile

Probability of drought:

- **Slight Chance:** 5 to 25% chance of occurring
- **Chance:** 30 to 55% chance of occurring
- **Likely:** 60 to 75% chance of occurring
- **Highly Likely/Expected:** Greater than or equal to 80% chance of occurring

Rainfall Description

The following definitions are being used on the 1981 to 2010 rainfall dataset:

- **Well Below normal:** Rainfall totals in the lowest 10% of the dataset
- **Below Normal:** Rainfall totals in the lowest 33.3% of the dataset
- **Near Normal:** Rainfall totals in the middle 33.3% of the data
- **Above Normal:** Rainfall totals in the highest 33.3% of the dataset
- **Well Above Normal:** Rainfall totals in the highest 10% of the dataset
- **Rainfall:** Island average, based on rainfall at the airport and Green Castle
